

Solensia in Cats

Solensia[®] is a monoclonal antibody (mAb), which is a highly specific protein targeting molecules involved in disease. It can dramatically reduce the pain caused by osteoarthritis in cats, which is very common, even in younger cats. It functions like naturally occurring antibodies, and is eliminated via normal protein degradation pathways, with minimal involvement of the liver or kidneys. Solensia[®] binds to Nerve Growth Factor (NGF), and its action helps to control pain and limit the release of proinflammatory mediators that increase inflammation and can lower neurogenic inflammation also. These combined actions can reduce the pain caused by osteoarthritis in cats.
